

Anshumaan Saraf

Forward Deployed Engineer | AI Healthcare | Full-Stack Builder

Gold Coast, QLD | anshumaansaraf24@gmail.com | heidi-voicemail.vercel.app

SUMMARY

Master of IT student and full-stack engineer who ships production systems end-to-end. Built Heidi Voicemail Intelligence — an AI triage dashboard for GP clinics — unprompted, because I saw a gap in the product surface. Background spans AI infrastructure, cloud-deployed e-commerce platforms, and regulatory-compliant systems built and shipped independently. Obsessed with AI healthcare, startup-wired, and learning everything from branding to RAG pipelines along the way. Looking for reps, not hand-holding.

TECHNICAL SKILLS

Frontend & Frameworks: Next.js 15, React.js, TypeScript, JavaScript (ES6+), Tailwind CSS v4, Radix UI, shadcn/ui, Framer Motion, Figma

AI & Data: LLM Integration (Claude, Ollama), Prompt Engineering, RAG Patterns, Deepgram ASR, LangChain, PostgreSQL (Neon), Prisma, Docker

Cloud & DevOps: AWS (Amplify, S3), Vercel, Git/GitHub, CI/CD Pipelines, Containerisation (Docker)

Professional: Product Thinking, Technical Documentation, Stakeholder Management, Agile/Scrum, Cross-Cultural Communication

FEATURED PROJECT — HEIDI VOICEMAIL INTELLIGENCE

Live: heidi-voicemail.vercel.app

End-to-end AI voicemail triage dashboard built on top of Heidi Health. Turns 20-40 raw after-hours GP voicemails into prioritised, structured work items for clinic admin staff — using Deepgram Nova-2 for transcription and Claude for structured JSON classification.

- Designed data model (voicemails + status_events), built 12 realistic seed voicemails with real audio recordings, and deployed live on AWS Amplify
- Implemented urgency classification (4 levels with confidence scores), intent detection (14 standardised codes), plain-English summaries, and suggested actions
- Built three-panel layout (sidebar, list, detail) matching Heidi's design language using actual brand tokens (#4c2934, #f7f1ee) and navigation patterns
- Architected AI pipeline: Deepgram Nova-2 (Australian English, speaker diarization) and Claude for single-pass structured extraction — costed at ~\$0.26/night for 30 voicemails
- Stack: Next.js 15 (App Router, SSR), TypeScript 5, Tailwind CSS v4, Radix UI, Neon serverless Postgres, AWS Amplify

PROFESSIONAL EXPERIENCE

Software Engineer — Infrastructure & Platform

Tasman Star Seafood | Gold Coast, Australia | Feb 2026 – Present

- Architected and deployed cloud-integrated AI inventory management system unifying stock tracking across all warehouse and retail locations, with demand forecasting and automated reorder triggers
- Built and operated custom operations infrastructure replacing Shopify and off-the-shelf SaaS tools, removing \$26,000+/year in third-party costs and improving system-wide reliability
- Shipped full-stack e-commerce platform with end-to-end payment processing and full Australian regulatory compliance (ACL, Privacy Act, PCI DSS), owning architecture, deployment, and maintenance as sole technologist

- Containerised services via Docker, managed AWS deployments supporting \$300K+ in projected annual revenue; automated regression testing and performance benchmarking with Python
- Developed iOS delivery verification app integrating GPS timestamps, photo proof-of-delivery, and customer sign-off — eliminating driver disputes

PROJECTS

Tasman Star Seafood — Full-Stack Commerce Platform

tasmanstarseafoodmarket.com.au

End-to-end B2B commerce platform built entirely in-house for Queensland's largest seafood distributor. Handles multi-party order flows, inventory reconciliation, payment processing, and regulatory reporting across wholesale, retail, and institutional channels.

Medicrew — Multi-Agent AI Orchestration

medicrew.vercel.app

Animated multi-agent AI orchestration system with real-time visualisation using Framer Motion. Implemented design system with reusable shadcn/ui components, Docker + Ollama support for local LLM inference, and Python integration tests validating agent response quality and latency.

Ambassador — AI Complaint Intelligence

ambassador-jade.vercel.app

AI-powered complaint management platform with real-time geospatial intelligence, server-sent event streaming, AI severity classification, and Python analytics pipeline providing insights into complaint trends and resolution rates.

ACHIEVEMENTS

- **Gold Coast Innovation Hub — AI Hackathon** | 1st Place — built fully functional prototype in 48 hours for Tech Ready Women
- **ANZ Cyber Crime Hackathon (Griffith University)** | 5th Place — security solution integrating AI detection and blockchain audit logs

EDUCATION

Master of Information Technology — Griffith University, Gold Coast | CGPA 6.5 | Expected 2027

Bachelor of Technology (CS & Engineering) — Parul University, India | CGPA 7.95 | 2025

CERTIFICATIONS

- Full Stack Development — GeeksforGeeks
- Data Structures & Algorithms — takeUforward (TUF+)
- Cloud Fundamentals — Amazon Web Services (AWS)
- Google Data Analytics & Advanced Analytics — Coursera
- Data Analytics with Python — NPTEL

Heidi Health
Entry Program — Forward Deployed Engineer

Dear Heidi Team,

You said the specific skills can be taught quickly, and that the underlying hardware cannot. So instead of explaining what I would do, I built something. Heidi Voicemail Intelligence is a full-stack AI triage dashboard that turns unstructured after-hours GP voicemails into prioritised, actionable work items for clinic admin staff. It is live at heidi-voicemail.vercel.app.

I chose this problem because I studied Heidi's product surface — Scribe, Evidence, Calls — and saw an obvious gap. After-hours voicemails are high-volume, zero-structure, and entirely manual. Admin staff have no urgency signals, no way to prioritise without listening to every recording. HVI solves that with Deepgram transcription, Claude classification, and a three-panel dashboard that sorts voicemails by urgency before anyone picks up a headset. I matched Heidi's design tokens, replicated the sidebar navigation, costed the AI pipeline at ~\$0.26/night for a typical clinic, and deployed it live on AWS Amplify.

This is how I work. At Tasman Star Seafood, I serve as the sole technologist — I designed and deployed a full-stack commerce platform from scratch, replaced \$26K/year in SaaS costs with custom infrastructure, and built an AI inventory system with demand forecasting. I shipped a production e-commerce platform handling \$300K+ in projected annual revenue with full Australian regulatory compliance. I am not someone who waits for a spec. I find the problem, pick a direction, make tradeoffs, and ship.

Over the past months, I have been going deep into AI healthcare — not because someone assigned it, but because I believe this is where the highest-leverage work is happening. I have been teaching myself everything the job demands: LLM integration, RAG patterns, prompt engineering, ASR pipelines, cloud deployment, product thinking, and even Heidi's brand system. I still do not know everything. But I am paving my way, and I learn fast.

As a Forward Deployed Engineer, I want to be embedded with strategic customers — the person who makes Heidi actually work in the real world. Technical onboarding, integration workflows, solving problems at the clinical edge. I do not need hand-holding. I need reps. I would welcome the chance to bring that energy to Heidi.

Warm regards,
Anshumaan Saraf
